Here is my summarised list of bugs and new features:

Bugs
- When clicking on a cinema on the map, the map does not snap to its location and no information about the cinema is displayed.
- When clicking on countries to filter by, the header of the country filter is not fixed to the top of the column causing overlapping of content when scrolling
- When switching the mapping library, the application hangs in a modal state with a dark screen, the user has to click away to return the screen to normal
- The map allows movement across the entire world, when it should keep a fixed boundary around the 2 valid regions, Australia and New Zealand.

New features
- More options to filter cinemas in the right side panel, for example products available to purchase, ticket prices, cinema rating scores, distance from your location
- The user should be able to view detailed information about a cinema including film showings, images and customer reviews
- Improve the styling of the application to be more suitable for a cinema
- Use the user's current location when the page loads to show a personalised map
- Add functionality for a user to make a booking once they've found a film and a cinema that they like
